Recommendations to the Authors

- a) The topic is of immediate relevance to the current situation and there is a need to address the risk of infection associated with paramedical staff and the physicians geographically.
- b) The authors have made a good attempt to capture the facilities provided to this staff and, whether they are able to conform to the PHE guidelines and their individual self-risk assessment, through a questionnaire-based survey. This could be one of those initial attempts to unveil the reality faced by the health workers while managing the patients, which may need immediate attention from policymakers.
- c) The authors need to mention the design - Cross-sectional survey in the writeup. There is no mention of the non-parametric test used. They can simply mention about bivariate logistic regression was used to determine...
- d) There are too many figures. The number can be reduced if there is a duplication of data in tables and figures. Please check.
- e) The conclusions are pertinent to the survey.
